Reference Story No.		Story Source	Story Summary
1	1	EECS 168	Lab 1: created a python program that performs basic arithmetic operations using user input
2	1	EECS 168	Lab 2: developed a program that converts temperatures between Celsius and Fahrenheit
3	1	EECS 268	Implemented linear search to find a specific value in a array
4	2	EECS 330	Implement Quick sort using python - Choosing a pivot, partitioning the list around it, and recursively sorting each side of the list
5	2	EECS 348	Lab 4: Football scores using C that asks the user for an NFL score and prints every combination of scoring plays that could add up to it.
6	2	EECS 348	Lab 4:Temperature Conversion programs using C that converts a temperature between Celsius, Fahrenheit, and Kelvin, then categorizes it with a weather advisory.
7	3	EECS 330	Implement Heap sort using Python - Build a max heap, writing a heapify function to restore heap order, and repeatedly swapping the root to the end of the list
8	3	EECS 348	Lab 5: Sales Report using C that reads 12 months of sales figures from a file and prints several reports on them: a table, a summary, a moving average, and a ranked list.
9	3	EECS 581	Project 2: Implement AI Easy - AI uncovers cells randomly, avoiding flagged or already uncovered cells in Minesweeper grid.
10	5	EECS 348	Lab 5: Matrix Manipulation using C that performs basic operations on 5×5 matrices: addition, multiplication, and transposition.
11	5	EECS 348	Lab 7: Matrix Manipulation using C++ that wraps 4×4 matrix operations in a Matrix class. It reads two matrices from the keyboard, then adds them, multiplies them, sums a diagonal, and swaps two rows.
12	5	EECS 348	Final Project (Arithmetic Calculator). The program accepted numerical inputs, performed arithmetic operations, and displayed the calculated results. The project required implementing calculation logic, handling user input, and verifying that the calculator produced correct results for different operations.
13	8	EECS 348	Lab 12: Number extraction using C++ that pulls the first floating-point number out of a line of text.
14	8	Research	Emotion Recognition ML Model
15	8	EECS 268	Developed a maze-solving program using a disjoint-set data structure. The program generates a maze by connecting cells while preventing cycles and ensures that a valid path exists between the starting and ending positions.

16	13	EECS 581	Project 2: Implement AI Medium - flag all hidden neighbors when their count equals a cell’s number, and open remaining hidden neighbors when flags match the number.
17	13	EECS 581	Project 2: Implement AI Hard - building on all Medium rules and adding the 1-2-1 pattern. When three adjacent revealed cells show 1-2-1, it flags the two outer hidden neighbors as mines and opens the inner one
18	13	Research	Privacy-Preserving HVAC Occupancy Modeling. Investigated local differential privacy for HVAC occupancy data. Implemented and compared Direct Encoding and Optimized Unary Encoding, evaluating data utility, estimation error, and privacy guarantees to understand the trade-offs between privacy protection and accurate occupancy estimation.
